

Normalization

Normalization

We discuss four normal forms: first, second, third, and Boyce-Codd normal forms
1NF, 2NF, 3NF, and BCNF

Normalization is a process that “improves” a database design by generating relations that are of higher normal forms.

The *objective* of normalization:

“to create relations where every dependency is on the key, the whole key, and nothing but the key”.

Normalization

There is a sequence to normal forms:

- 1NF is considered the weakest,
- 2NF is stronger than 1NF,
- 3NF is stronger than 2NF, and
- BCNF is considered the strongest

Also,

- any relation that is in BCNF, is in 3NF;
- any relation in 3NF is in 2NF; and
- any relation in 2NF is in 1NF.

Normalization

a relation in BCNF, is also in 3NF

a relation in 3NF is also in 2NF

a relation in 2NF is also in 1NF

Normalization

We consider a relation in BCNF to be fully normalized.

The benefit of higher normal forms is that update semantics for the affected data are simplified.

This means that applications required to maintain the database are simpler.

A design that has a lower normal form than another design has more redundancy. Uncontrolled redundancy can lead to data integrity problems.

First we introduce the concept of *functional dependency*

Functional Dependencies

Functional Dependencies

We say an attribute, B, has a *functional dependency* on another attribute, A, if for any two records, which have the same value for A, then the values for B in these two records must be the same. We illustrate this as:

A \square B

Example: Suppose we keep track of employee email addresses, and we only track one email address for each employee. Suppose each employee is identified by their unique employee number. We say there is a functional dependency of email address on employee number:

employee number \square email address

Functional Dependencies

<u>EmpNum</u>	EmpEmail	EmpFnam	EmpLnam
123	jdoe@abc.com	John	Do
456	psmith@abc.co	Peter	Smith
555	alee1@abc.com	Ala	Le
633	pdoe@abc.co	Peter	Do
787	alee2@abc.com	Ala	Le

n

e

If EmpNum is the PK then the FDs:

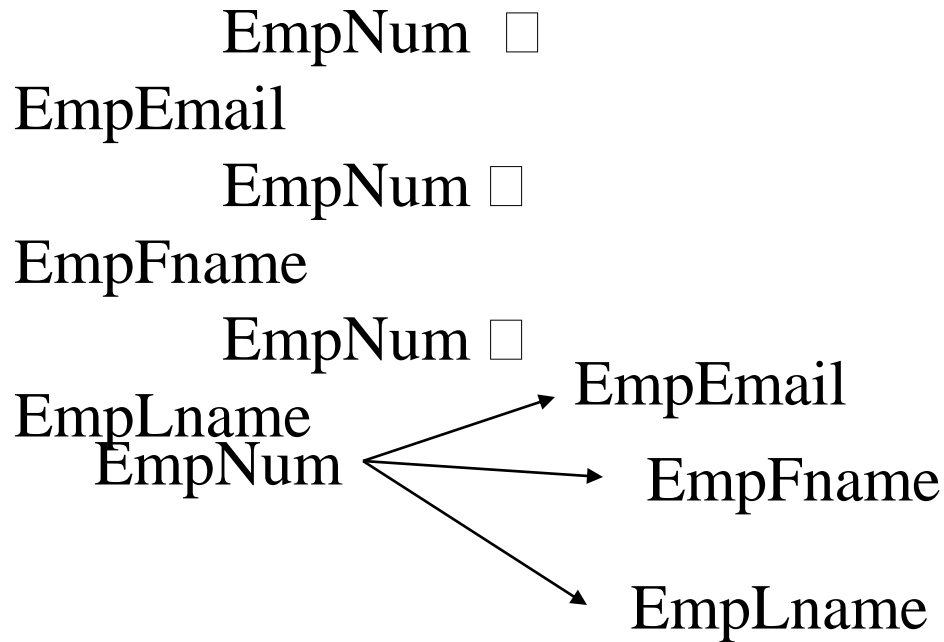

EmpNum \rightarrow EmpEmail

EmpNum \rightarrow EmpFname

EmpNum \rightarrow EmpLname

must exist.

Functional Dependencies

*3 different ways
you might see FDs
depicted*

Determinant

Functional Dependency

EmpNum \square
EmpEmail

Attribute on the LHS is known as the *determinant*

- EmpNum is a determinant of EmpEmail

Transitive dependency

Transitive dependency

Consider attributes A, B, and C, and where

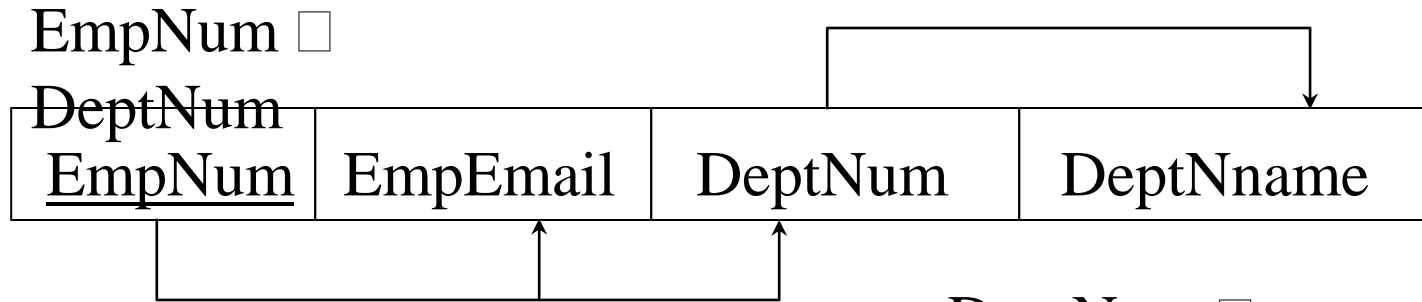

$A \twoheadrightarrow B$ and $B \twoheadrightarrow C$.

Functional dependencies are transitive, which means that we also have the functional dependency

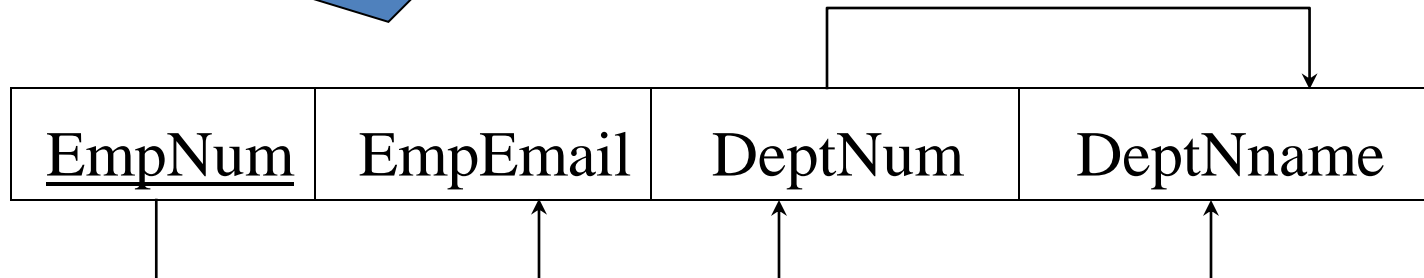

$A \twoheadrightarrow C$

We say that C is transitively dependent on A through B.

Transitive dependency

DeptNum ☐
DeptName

DeptName is *transitively dependent* on EmpNum via DeptNum

EmpNum ☐ DeptName

Partial dependency

A **partial dependency** exists when an attribute B is functionally dependent on an attribute A, and A is a component of a multipart candidate key.

Candidate keys: {InvNum, LineNum} InvDate is *partially dependent* on {InvNum, LineNum} as **InvNum is a determinant of InvDate and InvNum is part of a candidate key**

First Normal Form

First Normal Form

We say a relation is in **1NF** if all values stored in the relation are single-valued and atomic.

1NF places restrictions on the structure of relations. Values must be simple.

First Normal Form

The following is **not** in 1NF

<u>EmpNu</u>	EmpPhone	EmpDegree
123	233-	s
333	2836	BA, BSc,
679	1231	BSc, MSc

EmpDegrees is a multi-valued field:

employee 679 has two degrees: *BSc* and *MSc*

employee 333 has three degrees: *BA*, *BSc*, *PhD*

First Normal Form

<u>EmpNu</u>	EmpPhon	EmpDegrees
m 123	e233-	
333	2836	BA, BSc, PhD
679	1231	BSc, MSc

1231

To obtain 1NF relations we must, without loss of information, replace the above with two relations - see next slide

First Normal Form

Employee

EmpNum	EmpPhone
123	233-9876
333	233-1231
679	233-1231

EmployeeDegree

EmpNum	EmpDegree
333	BA
333	BSc
333	PhD
679	BSc
679	MSc

An outer join between Employee and EmployeeDegree will produce the information we saw before

Boyce-Codd Normal Form

Boyce-Codd Normal Form

BCNF is defined very simply:

a relation is in BCNF if it is in 1NF and if every determinant is a candidate key.

If our database will be used for OLTP (on line transaction processing), then BCNF is our target. Usually, we meet this objective. However, we might denormalize (3NF, 2NF, or 1NF) for performance reasons.

Second Normal Form

Second Normal Form

A relation is in **2NF** if it is in 1NF, and every non-key attribute is fully dependent on each candidate key. (That is, we don't have any partial functional dependency.)

- 2NF (and 3NF) both involve the concepts of key and non-key attributes.
- A *key attribute* is any attribute that is part of a key; any attribute that is not a key attribute, is a *non-key attribute*.
- Relations that are not in BCNF have data redundancies
- A relation in 2NF will not have any partial dependencies

Second Normal Form

Consider this **InvLine** table (in 1NF):

<u>InvNum</u>	<u>LineNum</u>	ProdNum	Qty	InvDate
---------------	----------------	---------	-----	---------

$\text{InvNum, LineNum} \longrightarrow \text{ProdNum, Qty}$

There are two
candidate keys.

Qty is the only non-
key attribute, and it is
dependent on InvNum

$\text{InvNum} \longrightarrow \text{InvDate}$

Since there is a determinant that is not a
candidate key, InvLine is **not BCNF**

InvLine is **not 2NF** since there is a partial
dependency of InvDate on InvNum

InvLine is only in 1NF

Second Normal Form

InvLine

<u>InvNum</u>	<u>LineNum</u>	ProdNum	Qty	InvDate
---------------	----------------	---------	-----	---------

The above relation has redundancies: the invoice date is repeated on each invoice line.

We can *improve* the database by decomposing the relation into two relations:

<u>InvNum</u>	<u>LineNum</u>	ProdNum	Qty
---------------	----------------	---------	-----

<u>InvNum</u>	InvDate
---------------	---------

Question: What is the highest normal form for these relations? 2NF? 3NF? BCNF?

Is the following relation in 2NF?

2NF, but not in 3NF, nor in BCNF:

EmployeeDept

since dnumber is not a candidate key and we have:

$dnumber \rightarrow dname$.

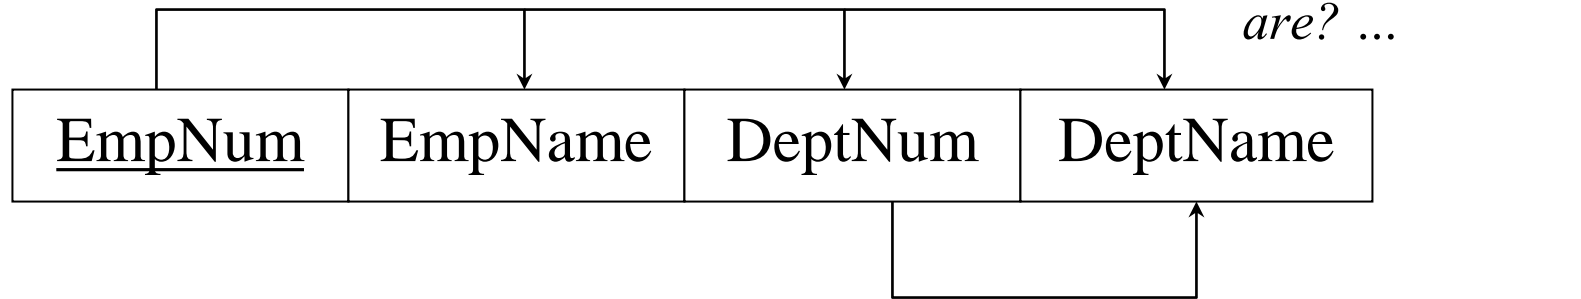

Third Normal Form

Third Normal Form

- A relation is in **3NF** if the relation is in 1NF and all determinants of *non-key* attributes are candidate keys
That is, for any functional dependency: $X \rightarrow Y$, where Y is a non-key attribute (or a set of non-key attributes), X is a candidate key.
- This definition of 3NF differs from BCNF only in the specification of non-key attributes - 3NF is weaker than BCNF. (BCNF requires all determinants to be candidate keys.)
- A relation in 3NF will not have any transitive dependencies of non-key attribute on a candidate key through another non-key attribute.

Third Normal Form

Consider this **Employee** relation

EmpName, DeptNum, and DeptName are non-key attributes.

DeptNum determines DeptName, a non-key attribute, and DeptNum is not a candidate key.

Is the relation in 3NF? ... no Is the relation in BCNF? ... no

Is the relation in 2NF? ... yes

Third Normal Form

We correct the situation by decomposing the original relation into two 3NF relations. Note the decomposition is *lossless*.

Verify these two relations are in 3NF.

In 3NF, but not in BCNF:

Instructor teaches one course only.

Student takes a course and has one instructor.

$\{\text{student_no}, \text{course_no}\} \rightarrow \text{instr_no}$
 $\text{instr_no} \rightarrow \text{course_no}$

since we have $\text{instr_no} \rightarrow \text{course_no}$, but instr_no is not a
Candidate key.

BCNF

$\{ \text{student_no}, \text{instr_no} \} \rightarrow \text{student_no}$
 $\{ \text{student_no}, \text{instr_no} \} \rightarrow \text{instr_no}$
 $\text{instr_no} \rightarrow \text{course_no}$
